Professional Experience

Front-End Software Engineer | PeopleConnect | San Diego, CA 2023 - Present

- Played a key role in migrating four core applications into a unified repository, building directly on prior standardization work to synchronize codebases for the first time in company history
- This initiative streamlined deployments, enabled cross-application code changes from a single update, and eliminated over 7 years of accumulated technical debt
- Audited and consolidated a fragmented internal utility library across the company's top-performing product, resolving version inconsistencies and duplicate logic to establish a single source of truth — improving code reliability and reducing long-term maintenance overhead
- Built and launched a cross-sell initiative leveraging the company's established user base across four flagship apps to drive adoption of a newer product line, which now accounts for over 30% of that product's total user base. Took full ownership of the program's evolution, running ongoing A/B tests on messaging, placement, and design to continuously optimize conversion
- Designed and led an A/B test on the mobile app registration funnel to identify friction points and improve completion rates, resulting in a 4%+ increase in conversion to sale
- Redesigned data-loading behavior to defer third-party API calls until explicitly triggered by user action, reducing unnecessary calls and cutting associated third-party costs by approximately 8%
- Piloted a Claude AI-Figma integration to accelerate front-end development, using AI to auto-generate baseline component code while serving as technical reviewer to ensure quality and accuracy — cutting production time by ~50% without sacrificing output quality
- Authored comprehensive front-end engineering documentation from day one at the company — covering environment setup, repository structure, and deployment processes — which became the standard onboarding resource and has since supported the successful onboarding of 4 engineers
- Led a team-wide training session on modern split-testing methodology and implementation, ensuring senior engineers were equipped to independently execute experiments and reducing single-point-of-failure risk on a core growth function
- Recognized company-wide with the "Q2 2026 People Who Rock" award for taking ownership of a previously unmanaged internal tool used by the Customer Care team, establishing a direct communication channel between Engineering and Customer Care to gather feedback and prioritize improvements — enhancing tool usability and cross-departmental collaboration

Software Engineer Teacher Assistant | Galvanize | Remote 2022 - 2023

- Mentored engineers across 5 cohorts, providing guidance in JavaScript, React, Node.js, and database fundamentals to develop full-stack applications
- Observed students to make sure their deadlines were met and reached out to those who fell behind to help create an improvement program with instructors

Technical Skills

- **Front-end Development:** Javascript, Typescript, React, Redux, HTML5, CSS3, Chakra-UI, Material-UI, TailwindCss, CSS Modules, Sass
- **Back-End Development:** GraphQL, Express, Koa, Node.js, MongoDB, PostgreSQL, MySQL, RESTful API
- **Testing/Deployment Suite:** Jest, Mocha, Chai, AWS, CI/CD, Docker
- **Developer Tools:** Git, Vite, Webpack, Babel, npm
- **AI Tools:** Claude, Cursor, Figma Integration

Education

Hack Reactor Software Engineering Certificate	2022
California State University, Long Beach Bachelor of Business Information Systems	2019
